How to gain
independence from
Internet service
providers?

Get more than one!

Visit antek.lv

Use and control several alternate providers **concurrently**

Diversity is a good way to achieve reliability and increased Performance.
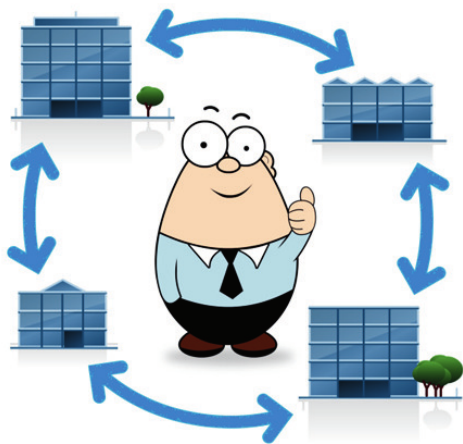

The secret is: *multipath*

Why choose abilis?

You suffer service discontinuities.

Managing the VPN create stress on you, who have a thousand other things to take care of.

You seek the freedom to change your service providers while keeping your public IP addresses unchanged.

You want to have full control over your network and like to be informed by your router when troubles occur.

Our solution

Enables to build resilient, multi-path, provider agnostic VPNs.

Permits to place a (virtual) router where you need it, even next to your cloud instances.

■ Reliability and Performance

Multi-path does not only mean **bandwidth**. Several lines grouped together create **high reliability**!

Abilis turns several consumer lines into one connection that's better than the premium one.

What can still fail is the hardware making the whole wizardry. Hence, **use 2 units** and get full backup!

■ Monitoring and Control

Our concept is that the router itself solves problems -even due to local abuse- whilst avoiding to raise alerts.

TWO units = full backup!

■ Multi-Level Security

We strive to apply defense measures across multiple levels of the network stack. Some of them are unconventional.

■ Smart control

Abilis provides fine control on all functions, as you expect to find in in a dedicated router – and adds up something unconventional.
